

“Acclimate” Your Tagawa Rose Bush

These roses grew up in our climate controlled greenhouse, and need to get used to the outside elements before planting.

This can be achieved by bringing the plant outdoors during the day over a period of 6 to 8 days

Keep in a semi-shaded (no harsh, direct sunlight) of your yard for the first 3 to 4 days, and then to a sunnier area for 3 to 4 more days before planting. If freezing temperatures are expected, move your rose into the garage or inside your home until danger has passed.

Remember to prune ½ the rose’s height after planting!

Tips for Success

1. “Acclimate” (put outside during daylight hours) your newly-purchased rose in its original pot during morning sun and evening shade for 6 to 8 days after purchase
2. Plant deeply where the graft (bud union) is 3” below the soil line
3. Prune back by about half its height and water deeply
4. Do not fertilize your newly-planted roses until next year

Always remember to winter water!
